Press Release : Monoscreen™ AbELISA - Ascaris suum
Innovation into parasitology through serology

The infestation of pig farms with *Ascaris suum* is the most prevalent parasitosis worldwide.

Bio-X Diagnostics is proud to announce the launch of its new serological kit in collaboration with Gent University on the basis of their well-known Serasca test.

This Monoscreen™ AbELISA -*Ascaris suum* test delivers a quick and accurate evaluation of the parasitic load. Based on the parasite hemoglobin, this indirect monowell Elisa test has proven to give relevant and early diagnostic of pig batch infestation on a regular evaluation of 10 pigs blood samples:

- Validation of the prevalence of intra-herd infestation in fattening units
- Monitoring of control and treatment strategies

Product presentations are available in four languages (English, French, German, Spanish) to present the main advantages of this new powerful diagnostical tool.
